

## Radical Technical Bulletin #3

Date: Thursday, 20 September 2007

Subject: Powertec ECU Upgrade

Powertec now have chipfiles available for 4-cylinder engines that enable the water pump (and cooling fan, if fitted) to operate and be controlled by the ECU, after the engine has been switched off. This should improve the heat soak condition that is currently experienced.

- When the engine is running, the radiator fan output is **ON** above 92°C and **OFF** below 90°C
- When the engine is running, the coolant pump is **ON** above 10°C and **OFF** below 0°C
  
- When the engine is stopped, the radiator fan will stay **ON** until below 90°C
- When the engine is stopped the coolant pump will stay **ON** until below 85°C

**This upgrade is available free-of-charge, please contact Powertec - +44 (0) 1733 331919**

Best regards

*Derek White*
